Message Handling and Event-Driven Programming

In MFC, almost all interactions are driven by messages. The message map system maps Windows messages (like clicks, keystrokes, or system events) to class member functions. This design simplifies event handling and encourages organized code structure.

Building Blocks of an MFC Application

Step 1: Setting Up the Project

The second edition emphasizes using Visual Studio's integrated project templates, which generate boilerplate code for various application types, such as SDI (Single Document Interface), MDI (Multiple Document Interface), and dialog-based applications.

Step 2: Creating Windows and Controls

MFC provides classes for standard Windows controls:

- CFrameWnd: Main application window frame.
- CDialog: Dialog boxes for user input.
- CButton, CEdit, CListBox, etc.: Standard controls with MFC wrappers.

Step 3: Implementing Message Maps

Defining message maps involves macros like `BEGIN_MESSAGE_MAP`, `END_MESSAGE_MAP`, and entries such as `ON_COMMAND`, `ON_WM_PAINT`, etc. These connect messages to handler functions, enabling responsive UI behavior.
