4. Metamorphism

- Existing rocks are subjected to high heat and pressure without melting.
- Causes mineral realignment and texture changes.
- Forms metamorphic rocks, often found deep within Earth's crust.

5. Uplift and Exposure

- Tectonic forces uplift rocks to Earth's surface.
- Exposure to surface conditions initiates weathering and erosion, restarting the cycle.

Step-by-Step Explanation of the Rocks Cycle

A simplified sequence of the rock cycle is as follows:

- Igneous rocks form from cooled magma or lava.
- These rocks are weathered and eroded into sediments.
- Sediments are deposited, compacted, and cemented into sedimentary rocks.

- Outcome: Formation of sedimentary rocks, which record Earth's surface history.

4. Metamorphism

- Process: Alteration of existing rocks by heat, pressure, and chemically active fluids.
- Reversibility: Generally irreversible without melting; metamorphic rocks can revert to other forms via melting or uplift and erosion.

5. Uplift and Exposure

- Tectonic forces uplift rocks, exposing them to surface conditions where weathering and erosion occur anew, closing the cycle.

The Cycle in Action: How Rocks Transform

The diagram demonstrates that the rock cycle is not linear but a network of pathways allowing rocks to transition between forms repeatedly. Some notable pathways include:

- Igneous to Sedimentary: Through weathering, erosion, and sedimentation.
