2. Group Properties

Question What is the difference between atomic number and atomic mass? Atomic number is the number of protons in an atom's nucleus, determining the element's identity. Atomic mass is the total mass of protons and neutrons in an atom's nucleus, representing the atom's mass in atomic mass units (amu). How do isotopes of an element differ from each other? Isotopes of an element have the same number of protons but different numbers of neutrons, resulting in different atomic masses but similar chemical properties. Explain the concept of valency with an example. Valency is the combining capacity of an element, usually determined by the number of electrons an atom can gain, lose, or share. For example, sodium (Na) has a valency of 1 because it loses one electron to achieve a stable octet. What is the octet rule? The octet rule states that atoms tend to gain, lose, or share electrons to attain a full outer shell of 8 electrons, achieving a stable electronic configuration similar to noble gases. Describe the structure of an atom according to the Bohr model. In the Bohr model, an atom consists of a small, positively charged nucleus at the center with electrons orbiting in specific circular paths or shells at fixed distances from the nucleus. What is a molecule and how is it different from an atom? A molecule is a group of two or more atoms chemically bonded together, representing the smallest unit of a compound with definite properties. An atom is a single unit of an element, not bonded to other atoms. Define electronegativity and its trend in the periodic table. Electronegativity is the tendency of an atom to attract electrons toward itself in a chemical bond. It increases across a period from left to right and decreases down a group from top to bottom. What are ionic bonds and how are they formed? Ionic bonds are electrostatic forces of attraction between oppositely charged ions, formed when one atom loses electrons to become a cation and another gains electrons to become an anion, as in the formation of sodium chloride (NaCl).
