Common Question Types and Their Review Answers

Let's explore typical questions encountered in physical science tests, along with detailed explanations of their answers.

1. Matter and Its Properties

Question: What is the difference between a physical change and a chemical change?

Review Answer:

- Physical Change: Alters the form or appearance of a substance without changing its composition. Examples include melting, freezing, cutting, and dissolving.
- Chemical Change: Produces a new substance with different properties. Indicators include color change, gas production, precipitate formation, or temperature change. Examples include combustion and rusting.

Deep Dive:

Understanding these differences helps in predicting reactions and understanding conservation of mass during changes. Remember, physical changes are reversible in most cases, while chemical changes often are not.

2. Atomic Structure and Periodic Table

Question: How do the number of protons, neutrons, and electrons determine an atom's identity and charge?

Review Answer:

- Protons: Define the atomic number and identity of the element.
- Electrons: Usually equal to protons in a neutral atom; their number determines the atom's charge.
- Neutrons: Contribute to atomic mass; variation in neutrons results in isotopes.
- Charge: If electrons $\neq$ protons, the atom becomes an ion (negative if electrons $>$ protons, positive if fewer).

Deep Dive:

Mastering atomic structure is vital for understanding chemical bonding and reactions. Use diagrams to visualize electron shells and how they influence reactivity.

3. Forces and Motion

Question: What is Newton's Second Law of Motion?

Review Answer:

- $F = ma$ (Force equals mass times acceleration).
- The law states that the acceleration of an object depends directly on the net force applied and inversely on its mass.

Deep Dive:

Applying this formula helps solve problems involving force, mass, and acceleration. Practice with real-world examples, like pushing carts or launching projectiles, to understand how forces influence motion.

4. Energy Concepts

Question: What is the difference between kinetic and potential energy?

Review Answer:

- Kinetic Energy: Energy possessed by a moving object, calculated as $KE = \frac{1}{2} mv^2$.
- Potential Energy: Stored energy due to position or configuration, such as an object at height or stretched spring.

Deep Dive:

Understanding energy transformations is crucial. For example, a roller coaster converts potential energy at the top into kinetic energy during descent. Recognizing these conversions helps answer questions related to energy conservation.

5. Waves and Light

Question: How does the frequency of a wave relate to its energy?

Review Answer:

- Higher frequency waves carry more energy, according to the equation $E = hf$, where h is Planck's constant and f is frequency.

Deep Dive:

This concept explains phenomena like ultraviolet light being more energetic than visible light, and why gamma rays are more damaging than radio waves. Recognizing wave properties aids in understanding electromagnetic spectrum applications.

6. Electricity and Magnetism

Question: What is Ohm's Law?

Review Answer:

- $V = IR$, where V is voltage, I is current, and R is resistance.

- The law states that the current flowing through a conductor between two points is directly proportional to the voltage across the points, provided temperature remains constant.

Deep Dive:

Applying Ohm's Law helps analyze circuits, troubleshoot electrical problems, and understand the relationship between voltage, current, and resistance.

7. Earth Science

Question: What causes the movement of tectonic plates?

Review Answer:

- Convection currents in the Earth's mantle generate forces that cause tectonic plates to move. These currents result from heat transfer from the Earth's interior, causing mantle material to circulate and exert force on the crust.

Deep Dive:

Understanding plate tectonics explains phenomena such as earthquakes, volcanic activity, and mountain formation. Visual aids like diagrams of mantle convection can reinforce these concepts.

Sample Questions and Model Answers in Pearson Physical Science Optics

Question 1: Reflection

Q: A ray of light strikes a mirror at an incident angle of 30° . What is the angle of reflection?

A: The angle of reflection equals the incident angle, so 30° .

Question 2: Lens Image Formation

Q: An object is placed 10 cm in front of a convex lens with a focal length of 15 cm. Use the lens formula to find the image distance.

A: Using the lens formula:

[

$$\frac{1}{f} = \frac{1}{d_o} + \frac{1}{d_i}$$

]

[

$$\frac{1}{15} = \frac{1}{10} + \frac{1}{d_i}$$

]

[

$$\frac{1}{d_i} = \frac{1}{15} - \frac{1}{10} = \frac{2}{30} - \frac{3}{30} = -\frac{1}{30}$$

]

$\backslash$

$$d_i = -30\text{ cm}$$

 $\backslash$

The negative sign indicates the image is virtual and on the same side as the object, located 30 cm from the lens.
