Xylem and phloem are the two types of vascular tissues in plants:

- Xylem: Transports water and minerals from roots to leaves. It is composed of dead cells that form hollow tubes, providing structural support.
- Phloem: Transports sugars and organic nutrients made in the leaves to other parts of the plant. It consists of living cells, such as sieve tubes and companion cells.

Key point: Both tissues are crucial for nutrient distribution and plant survival.

Q3: What is the significance of the alternation of generations in plants?

Answer:

The alternation of generations describes the life cycle of plants, involving two distinct phases:

- Sporophyte (diploid): The dominant, multicellular stage that produces spores via meiosis.
- Gametophyte (haploid): The stage that produces gametes (sperm and eggs) through mitosis.

Significance:

This cycle allows genetic diversity and adaptation, enabling plants to reproduce effectively in various environments.

Q4: How do gymnosperms differ from angiosperms?

Answer:

Gymnosperms:

- "Naked seeds" (not enclosed in fruit)
- Usually cone-bearing
- Mostly evergreen trees
- Examples: pines, spruces, firs

Angiosperms:

- "Covered seeds" enclosed within fruits
- Have flowers and fruit structures
- Most diverse group of plants
- Examples: roses, grasses, oaks

Key point: The presence of flowers and enclosed seeds distinguishes angiosperms from gymnosperms.

Question 1: Cell Structure Identification

Question:

Label the parts of the plant cell in the diagram below and explain the function of the chloroplast.

Answer:

- Labels:

- Cell Wall
- Cell Membrane
- Cytoplasm
- Nucleus
- Chloroplast
- Vacuole

- Function of Chloroplast:

Chloroplasts are organelles found in plant cells responsible for photosynthesis. They contain the pigment chlorophyll, which captures light energy to convert carbon dioxide and water into glucose and oxygen. This process provides energy for the plant and forms the basis for the food chain.

Question 2: Genetic Crosses and Punnett Squares

Question:

In pea plants, the allele for tall stems (T) is dominant over the allele for short stems (t). If two heterozygous tall plants are crossed, what is the probability of obtaining a tall plant? Show your work.

Answer:

- Punnett Square:

| | T | t |

|----|---|---

| T | TT | Tt |

| t | Tt | tt |

- Genotype probabilities:

- TT: 1

- Tt: 2

- tt: 1

- Phenotype (Tall vs. Short):

- Tall: TT + Tt (3 out of 4)

- Short: tt (1 out of 4)

- Probability of Tall Plant:

- 3/4 or 75%

Therefore, there is a 75% chance of obtaining a tall plant from this cross.

Question 3: Photosynthesis Process Explanation

Question:

Describe the process of photosynthesis, including the raw materials and the main products.

Answer:

Photosynthesis is a biochemical process used by green plants, algae, and some bacteria to convert light energy into chemical energy stored in glucose. It occurs primarily in the chloroplasts of plant cells.
